#### Guava InternalFutureFailureAccess and InternalFutures

**Description:** Contains com.google.common.util.concurrent.internal.InternalFutureFailureAccess and InternalFutures. Most users will never need to use this artifact. Its classes is conceptually a part of Guava, but they're in this separate artifact so that Android libraries can use them without pulling in all of Guava (just as they can use ListenableFuture by depending on the listenablefuture artifact).

**Project Licenses:** The Apache Software License, Version 2.0

- com.google.guava:listenablefuture:jar:9999.0-empty-to-avoid-conflict-with-guava (compile)

#### Guava ListenableFuture only

**Description:** An empty artifact that Guava depends on to signal that it is providing `ListenableFuture` -- but is also available in a second "version" that contains `com.google.common.util.concurrent.ListenableFuture` class, without any other Guava classes. The idea is: - If users want only `ListenableFuture`, they depend on `listenablefuture-1.0`. - If users want all of Guava, they depend on `guava`, which, as of Guava 27.0, depends on `listenablefuture-9999.0-empty-to-avoid-conflict-with-guava`. The 9999.0-... version number is enough for some build systems (notably, Gradle) to select that empty artifact over the "real" `listenablefuture-1.0` -- avoiding a conflict with the copy of `ListenableFuture` in `guava` itself. If users are using an older version of Guava or a build system other than Gradle, they may see class conflicts. If so, they can solve them by manually excluding the `listenablefuture` artifact or manually forcing their build systems to use 9999.0-....
